

SUSTAINABILITY - 101

Minor Assignment

Format: 1-Page PDF Submission

Deadline: Wednesday EOD

Situation

You have officially joined the Sprint Sustainability Transformation Taskforce.

Before the consulting team can begin building Sprint's greenhouse gas inventory, the leadership team needs to ensure that all analysts understand one of the most fundamental concepts in carbon accounting:

Emission Categorization.

Mis-classifying emissions can lead to inaccurate carbon inventories, incorrect reduction strategies, and unreliable sustainability reporting.

As a newly appointed Sustainability Analyst, your first task is to classify operational activities into the correct emissions category under the GHG Protocol.

Background

Sprint operates a hyper-growth quick-commerce network serving millions of customers across multiple cities.

Its operations involve:

- Dark stores
- Delivery fleets
- Packaging suppliers
- Warehousing partners
- Technology infrastructure
- Third-party service providers

Each activity generates emissions, but not all emissions are treated the same way.

Under the GHG Protocol, emissions are categorized into:

Scope 1

Direct emissions generated from assets and operations owned or controlled by Sprint.

Scope 2

Indirect emissions associated with purchased electricity, heating, cooling, or steam consumed by Sprint.

Scope 3

All other indirect emissions generated throughout Sprint's value chain.

Your Task

You have been provided with five operational activities occurring within Sprint's business ecosystem.

For each activity:

Step 1

Identify whether the activity belongs to:

- Scope 1
- Scope 2
- Scope 3

Step 2

Provide a one-sentence justification explaining why the activity belongs to that category.

Your explanation should demonstrate understanding of ownership, operational control, and indirect value-chain emissions.

Activities for Classification

Activity A

Petrol consumed by Sprint-owned delivery bikes during customer deliveries.

Activity B

Electricity consumed by Sprint's dark stores and fulfillment centers.

Activity C

Manufacturing of plastic packaging bags purchased from external suppliers.

Expected Submission Format

Activity	Scope Category	Justification
Activity A	Scope ?	Your explanation
Activity B	Scope ?	Your explanation
Activity C	Scope ?	Your explanation

Evaluation Criteria

Your submission will be assessed on:

Accuracy of Classification (50%)

Have the activities been assigned to the correct scope?

Quality of Reasoning (30%)

Does the justification demonstrate understanding of emission ownership and responsibility?

Clarity of Communication (20%)

Are explanations concise, logical, and professionally written?

Analyst Note

A common mistake in carbon accounting is assuming that every emission generated by a company's operations belongs to Scope 1.

Before assigning a category, always ask:

Who owns the source of emissions?

Who controls the activity?

Does the emission occur directly within the company, through purchased energy, or elsewhere in the value chain?

Answering these questions correctly is the foundation of every greenhouse gas inventory.
